What is a Software?

Software is a set of instructions, programs, or data that tells a computer or digital device what to do and how to perform tasks.

Categories of software:

- System software
- Application software

System software -

A system software is the software that runs and controls the computer. It helps the hardware and applications to work together.

Types of System Software:

- A. Operating System (OS)
- B. Utility Program

Types of System Software:

A. Operating System (OS) -

An Operating System is the main software that manages the computer and allows users to run applications.

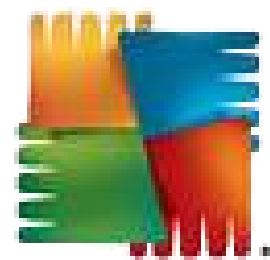

Linux

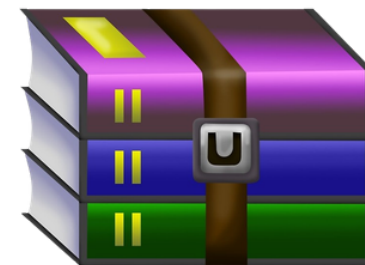

Types of System Software:

B. Utility Program -

A Utility Program is software that helps maintain, protect, and improve the performance of a computer.

AVG

Application software -

Application software is software that allows users to perform specific tasks. It is designed for direct use by people to get work done or for entertainment.

Factors to Consider Before Installing Software

1

Necessity

Do I really need this software?

2

Requirements

Can my computer handle this software?

3

Support

Will I get help if something goes wrong?

Software Installation

How software is installed in Linux:

Package Manager -

A package manager is a software tool that helps users install, update, configure, and remove software packages on a computer system in an easy and automated way.

Commonly used package managers in Linux are:

- RPM (Red Hat Package Manager)
- YUM (Yellowdog Updater Modified)
- APT (Advanced Package Tool)

Linux Family

Different Linux families use different package managers.

Red Hat Linux

AlmaLinux

CentOS

Fedora

They usually use package manager:

- **RPM**
- **YUM / DNF**

Meaning:

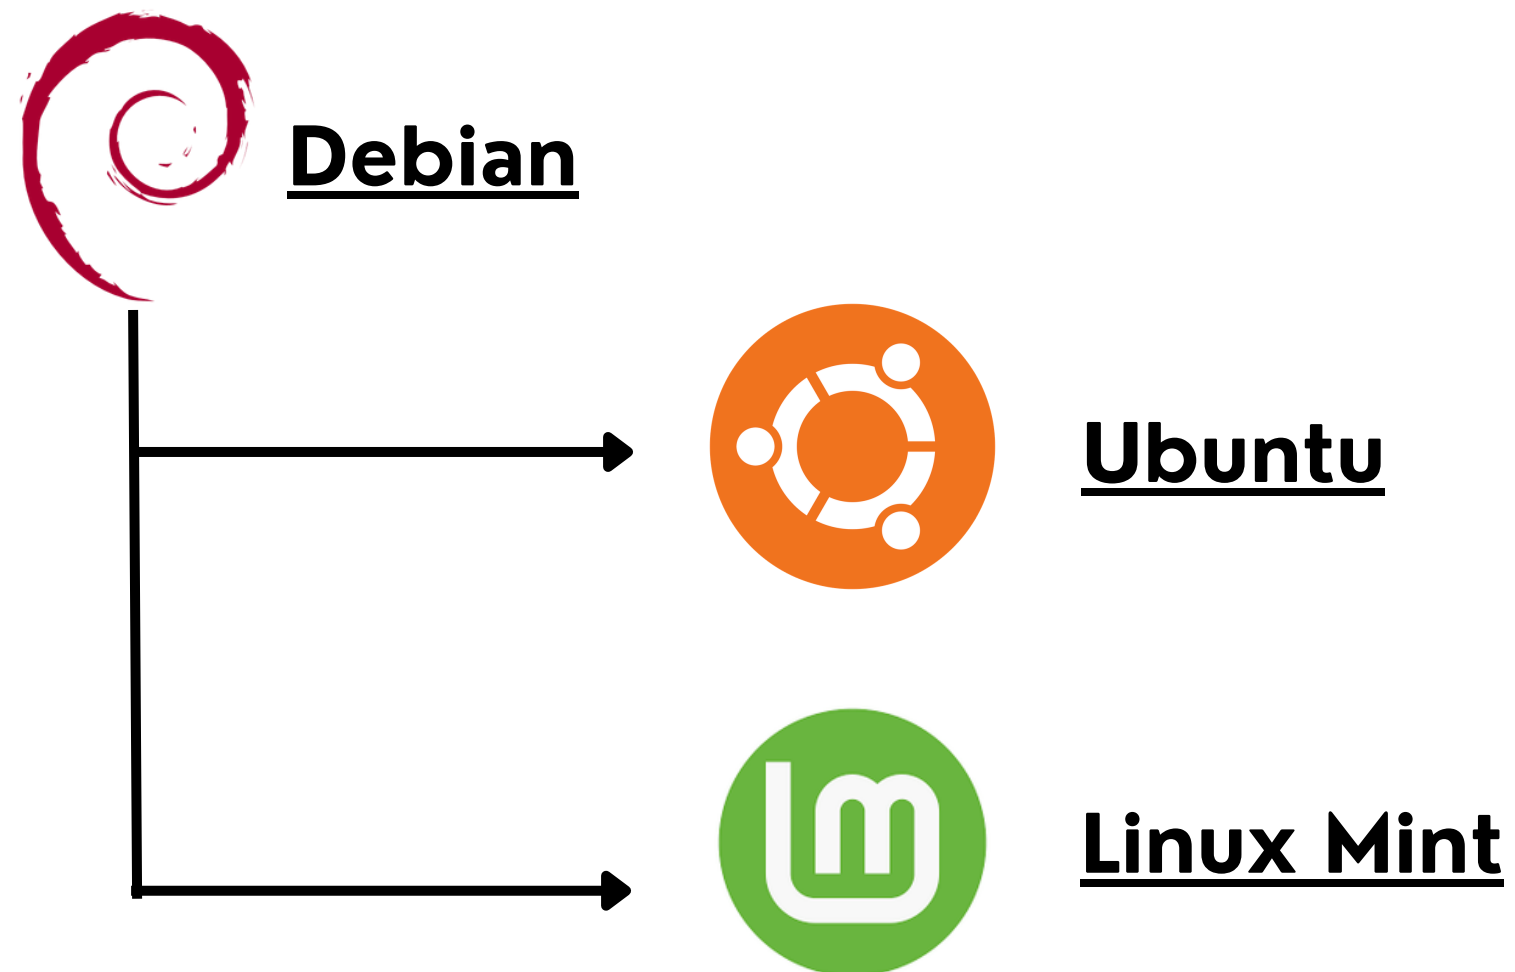

If you learn RPM or YUM, you can use it on:

- AlmaLinux
- CentOS
- Fedora

because they belong to the same family.

Linux Family

Different Linux families use different package managers.

They usually use:

- **APT**

Meaning:

If you learn APT, you can use it on:

- Ubuntu
- Linux Mint

because they belong to the same family.

Linux Family

Analogy:

Android

Think of Linux families like phone brands that came from one main design.

Samsung

They are all Android, but each company changes some features. Linux works the same way.

Oppo

Xiaomi

Package Managers in Linux

RPM (Red Hat Package Manager)

RPM is a basic package management system used in Linux systems. It is used to install, update, and remove software packages manually, it does not automatically handle dependencies well.

Package Managers in Linux

YUM (Yellowdog Updater Modified)

YUM is built on top of RPM. It makes package management easier by automatically handling dependencies.

Package Managers in Linux

APT (Advanced Package Tool)

APT is similar to YUM but is known for being faster and more efficient in downloading and managing packages. It also automatically handles dependencies.

Software Maintenance

What happens after installation:

Software maintenance is the process of modifying, updating, fixing, and improving software after it has been installed to keep it working properly.

- Updating software
- Fixing bugs
- Improving security
- Reinstalling broken software
- Removing unused software

Thank You
